may or may not be granted. Thus, since various types of electrical power are transmitted by the controller at various times, the controller controls the electrical power to the profusion device. It is therefore respectfully submitted that support is found within the original specification for the adapter to control the power to the profusion device as currently claimed. It is therefore respectfully requested that the Examiner withdraws the rejection to claims 16-21 under 35 U.S.C. §112, first paragraph.

Claims 16, 18 and 21 claim an adapter pod for use in a medical perfusion system. The medical perfusion system has a main controller and a data communications network with a plurality of connection points, each connection point having a substantially identical network connector. The adapter pod comprises a common connector, a device connector and a controller or means. The common connector is adapted to be connected to one of the network connectors and has a connector configuration. The device connector is adapted to be connected with a perfusion device and has a connector configuration which is different than the connector configuration of the common connector. The controller or means is adapted to generate messages, in the form of digital data packets, for the main controller and perfusion device and controls electrical power to the perfusion device.

Through the structure of the claimed invention having a controller or means controlling power to a perfusion device, as claimed in claims 16, 18 and 21, the claimed invention provides an adapter pod in which it is easy to convert a perfusion system designed for one purpose into a perfusion system usable for a different purpose. The prior art does not show, teach or suggest the structure of an adapter pod as claimed in claims 16, 18 and 21.

Application No. <u>09/030,989</u> Attorney's Docket No. <u>032722-421</u> Page 3

Claims 16-22 were rejected under 35 U.S.C. § 103 as being unpatentable over

Dais et al. (U.S. Patent No. 5,524,213) in view of Omori (U.S. Patent No. 5,820,414) or

alternately in combination with Schenk (U.S. Patent No. 5,444,626).

Applicants respectfully traverse the Examiner's rejection of the claims under 35 U.S.C. §103. Claims have been reviewed in light of the Office Action, and for reasons which will be set forth below, it is respectfully requested that the Examiner withdraws the rejection to the claims and allows the claims to issue.

Dais et al. appears to disclose process control which takes place especially in motor vehicles, industrial robots, medical monitoring and analyzing apparatus, elevator systems and the like. In recent years, the data exchange for this process control between the individual opened-loop and closed-loop control units have taken place increasingly with the aid of methods for serial data exchange. Two classes of protocols have been formed including protocols having messages with short identifiers and protocols having messages with long identifiers (col. 1 lines 10-33). A method is therefore provided for operating a data-processing system as well as a method for structuring messages which is flexible with respect to the particular requirements. The method affords the advantage with respect to the state of the art that within one and the same bus system messages having identifiers of different lengths can be transmitted consistently and free of interaction with one and the same protocol (col. 2 lines 1-11). Figure 6 is a schematic of a data processing system for use in a motor vehicle having several control apparatus operating at different locations and which are interconnected via a linear bus structure. The control apparatus are: an engine control unit 1, a transmission control unit 2, an ABS-control unit 3, a steering control unit

Application No. <u>09/030,989</u> Attorney's Docket No. <u>032722-421</u> Page 4

4 and a climate control unit 5. Each of the control units has an interface component 8. A possible interface control unit 8 can, for example, be a CAN-controller which can carry out the data transmission according to the CAN-protocol. The interface component 8 must therefore be able to process message formats for long and short formats. Each interface component is connected to the bus line 7. A passive termination component 6 is disposed at the ends of the bus line 7 as a termination thereof (col. 9 lines 15-28). For data transmissions, that station which wishes to transmit data, sends a transmission request to the interface component 8 corresponding thereto. The interface component 8 which is addressed then carries out the transmission command independently and thereafter issues a transmission announcement to the station. The transmission announcement can contain the successful execution of the transmission command as well as possible error messages (col. 9 lines 47-54).

Thus, <u>Dais et al.</u> discloses a plurality of interface components 8 which carry out data transmission according to CAN-protocol. Nothing in <u>Dais et al.</u> shows, teaches or suggests a controller of an adapter pod which controls electrical power to a perfusion device as claimed in claim 16, 18 and 21. Rather, <u>Dais et al.</u> merely discloses that the interface components 8 carry out data transmission according to CAN-protocol.

Omori appears to disclose an IC card adapter including a main connector to provided on a side of a body while a plurality of sub-connectors 3A, 3B are provided on the reverse side. The main-connector 2 is for obtaining an electrical connection with an equipment (e.g. a personal computer) in which the IC card 1 is used. On the other hand, sub-connectors 3A, 3B are for obtaining electrical connection with adapters (col. 6 lines

Application No. <u>09/030,989</u> Attorney's Docket No. <u>032722-421</u> Page 5

37-45). The IC card 1 includes a frame pod made of plastic which forms an outer shape of a card body, and an electrical circuit board 6 in which prescribed electronic components 7 included semiconductor circuits are incorporated, and, a main-connector 2 and the subconnectors 3A, 3B are mounted at a front end portion and a rear end portion of the electric circuit board 6 respectively (col. 6 lines 54-61). A IC card adapter 11 to be used by connecting to the IC card 1 includes a plurality of adapter-side main-connectors 12A, 12B (primary connectors) to be respectively coupled with the sub-connectors 3A, 3B of an IC card 1 and are provided on a side of the adapter 11. On the other hand, one or a plurality of adapter-side sub-connectors 13 are provided on the reverse side. To this adapter-side sub-connector 13, a connector 19 with a cable is connected, and at another end of the cable 19A of the connector 19, for example a connector (not shown) to be connected electrically to a telephone circuit is provided. The IC card adapter 11 includes a frame 15, and an electric circuit board 16 in which prescribed electronic components 17 are incorporated (col. 7 lines 11-30). A unit of the electric circuit board 16 mounted with the electronic components, etc. 17 and each connector 12A, 12B, 13 in such a way, is named adaptor module 18. By connecting the adaptor 11 to the IC card 1 after mounting the IC card 1 to a personal computer for example, each electric circuit or electronic circuit on the adaptor module 18 is driven by electric power supplied from the personal computer through the IC card 1. Alternatively, the adaptor may have its own battery, by enabling the adaptor 11 to be mounted with a thin battery such as a lithium battery. (col. 7, lines 38-48, emphasis added) The electric circuit board 16 mounted with the electronic components form an adapter module 18 which has a telephone function including a speaker function and a

microphone function which is different from the function which the IC card 1 has possessed primarily (col. 8 lines 20-25).

Thus, <u>Omori</u> merely discloses driving an adapter module with electric power supplied from a personal computer through an IC card 1. Nothing in <u>Omori</u> shows, teaches or suggests controlling electrical power as claimed in claims 16, 18 and 21. Rather, power is simply supplied through the IC card 1 and is <u>not</u> controlled.

Schenk appears to disclose a control system for a motor vehicle including a central processing unit 20, an ignition module 21, a fuel injection module 22 and a brake module 23. The components are connected to an external data bus 24. For connection to the external data bus 24 each component is provided with an interface 25. In addition to the interface 25, the central processing unit 20 is provided with a microprocessor 20a and a memory component 20b (col. 2 line 63 through col. 3 line 7). In addition to their interfaces 25, each of the depicted modules 21, 22 and 23 is also provided with a microprocessor as well as a memory component and input and output circuits (col. 2 lines 36-39). For calculating the respective parameter control values, transducer signals from individual control modules 21, 22 and 23 must be fed to the central processing unit 20. For that reason, the modules are continually transmitting these values to the central processing unit 20 by way of the external data bus 24 (col. 3 lines 57-62).

Thus, <u>Schenk</u> merely discloses modules 21, 22 and 23 which output transducer signals to the central processing unit 20. Nothing in <u>Schenk</u> shows, teaches or suggests a controller of an adapter pod which controls electrical power to a profusion device as

claimed in claims 16, 18 and 21. Rather, <u>Schenk</u> merely discloses modules which transmit transducer signals to a central processor.

Since nothing in <u>Dais et al.</u>, <u>Omori</u> or <u>Schenk</u> show, teach or suggest an adapter pod having a controller which controls electrical power to a perfusion device as claimed in claim 16, 18 and 21, it is respectfully requested that the Examiner withdraws the rejection to claim 16, 18 and 21 under 35 U.S.C. §103.

Claims 17, 19-20 and 22 depend from claims 16, 18 and 21 and recite additional features. It is respectfully submitted that claims 17, 19-20 and 22 would not have been obvious within the meaning of 35 U.S.C. § 103 over <u>Dais et al.</u>, <u>Omori</u> and <u>Schenk</u> at least for the reasons as set forth above. Therefore, it is respectfully requested that the Examiner withdraw the rejection to claims 17, 19-20 and 22 under 35 U.S.C. § 103.

Thus it now appears that the application is in condition for reconsideration and allowance. Reconsideration and allowance at an early date are respectfully requested.

Should the Examiner find that the application is not now in condition for allowance, it is respectfully requested that the Examiner enters this Amendment for purposes of appeal.

If for any reason Examiner feels that the application is not now in condition for allowance, it is respectfully requested that the Examiner contact, by telephone, the Applicants' undersigned attorney at the indicated telephone number to arrange for an interview to expedite the disposition of this case.

In the event that this paper is not timely filed within the currently set shortened statutory period, Applicants respectfully petition for an appropriate extension of time. The fees for such extension of time may be charged to our Deposit Account No. 02-4800.
